Associate Engineer – Technology:

As a Fresher Looking forward for a challenging career which demands for best of my professional in terms of technical as programming and communication.

Core Competencies:

- Adaptability
- Good Communication Skills
- Leadership
- Quick Learner
- Problem Solving
- Work Ethic

Tools and Technologies:

- Java
- Spring Framework
- Springboot
- MySQL
- Hibernate
- Microservices
- Angular

Responsibilities:

- Contributing strategically to planning, managing and executing organization goals.
- Interacting with clients and teams to understand project requirements.
- Flexible in working under challenging and changing work strategies

Educational Qualifications:

BTECH
(2021-2025)

Aditya Engineering College.

Training Assignments in Virtusa:

Project Title: **Training Management System**

Technology: Java (8–17), Spring Boot, Spring Cloud, OpenFeign, Eureka Server, API Gateway, Spring Data JPA, MySQL (RDBMS), Config Server, Resilience4j (Circuit Breaker), REST APIs, Maven

Description: .The Training Management System is a microservices-based application built using Spring Boot and Spring Cloud to manage employee training workflows efficiently. It includes services like Employee, Training, PM, and Admin, where employees can view trainings and nominate themselves, PMs can approve or reject nominations, and admins manage venues and scheduling. The system uses Eureka Server for service discovery, API Gateway for routing, and OpenFeign for inter-service communication. Configuration is centralized using Config Server, and Resilience4j Circuit Breaker ensures fault tolerance. Data is managed using Spring Data JPA with MySQL, making the system scalable, modular, and suitable for real-world enterprise applications.

Project Title: **Smart Order Analytics System (Java 8–17)**

Technology: Java (8–17), Java Streams & Functional Programming, Java Records, Optional & Switch Expressions, JDBC (MySQL / RDBMS), Java Collections

Description: The Smart Order Analytics System is a Java-based application developed using Java 8–17 features to process and analyze customer orders efficiently. It uses immutable data models with Java records, functional programming, and Stream APIs to validate orders, apply discount rules, and generate analytical reports. Customer-wise aggregation, classification, and top-customer identification are implemented using collectors and lambdas. The system integrates **JDBC** to persist and retrieve order data from a relational database, ensuring real-world backend applicability with clean and readable design.
