Gaddbharat@virtusa.com

Associate Engineer – Technology:

As a Fresher Looking forward for a challenging career which demands for best of my professional in terms of technical as programming and communication.

Core Competencies:

- Good Communication Skills
- Team Collaboration
- Problem Solving
- Quick Learning Ability
- Continuous Learning
- Adaptability

Tools and Technologies:

- Java
- Springboot
- Spring Data JPA
- Micro services
- MySQL
- Hibernate
- HTML, CSS
- IntelliJ IDE, VS code
- Angular

Responsibilities:

- Assisting in the planning and development of Java Full Stack applications as part of team goals.
- Supporting project tasks and contributing to the successful completion of assigned work during training and development phases.
- Learning and applying new technologies while working in a fast-changing and challenging environment.

Educational Qualifications:

BTECH (IT)
(2021-2025)

Aditya Engineering College.

Training Assignments in Virtusa:

Project Title: **Training Management System**

Technology: Java (8–17), Spring Boot, Spring Cloud, OpenFeign, Eureka Server, API Gateway, Spring Data JPA, MySQL (RDBMS), Config Server, Resilience4j (Circuit Breaker), REST APIs, Angular.

Description: The Training Management System is a microservices-based application built using Spring Boot and Spring Cloud to manage employee training workflows efficiently.

It includes services like Employee, Training, PM, and Admin, where employees can view trainings and nominate themselves, PMs can approve or reject nominations, and admins manage venues and scheduling. The system uses Eureka Server for service discovery, API Gateway for routing, and OpenFeign for inter-service communication.

Configuration is centralized using Config Server, and Resilience4j Circuit Breaker ensures fault tolerance. Data is managed using Spring Data JPA with MySQL, making the system scalable, modular, and suitable for real-world enterprise applications.

Project Title: **Fantasy Sports League System**

Technology: Spring Boot, Spring Cloud, Eureka Server, API Gateway, Spring Data JPA, MySQL, OpenFeign, REST APIs, Kafka, JWT Authentication, Swagger, Microservices Architecture

Description: The Fantasy Sports League System is a backend microservices project inspired by Dream11. It allows users to create fantasy teams using real players and join different contests. Users earn points based on real match performance.

The system includes features like user registration, team creation, contest joining, and leaderboard generation. Teams are

created within a fixed budget and locked before match start. Admins manage match data and update results.

A scoring system calculates points and updates leaderboards after each match. The application uses Spring Boot microservices with Eureka Server and API Gateway. JWT is used for security and MySQL is used for data storage. The system is scalable and supports real-time updates.
